

Why Ajax

Intuitive mobile app

An Ajax app provides real-time system status updates and remote control from anywhere.

Stable connection at all times

Two independent communication channels ensure a steady cellular connection even as you move.

Visual alarm verification

Motion detectors with cameras capture an alarm, and you can see the photos of the incident within seconds in an Ajax app. Or check on your camper anytime with a Photo on demand feature.

Year-round solution

An Ajax system can keep watch of your motorhome whether it is on the road or parked in a seasonal parking lot.

Exceptional autonomy

Ajax devices ensure up to 7 years of autonomous operation on pre-installed batteries with minimal maintenance.

Easy installation

With Ajax, it takes an hour to set up full-fledged protection of a vehicle. Then, just as quickly, wireless detectors can be dismantled and reused elsewhere.

Next level of informing

You receive informative push notifications about all events in the system, be it a low battery charge, attempts to detach a device, or movement detected nearby.

Versatile power options

No power? No problem. The hub can be powered by an automotive battery or any other 12-24 V power source.

Powerful deterrence

Indoor and outdoor sirens not only inform of an alarm but also scare off intruders with loud sound signal.

TP SECURITY

Solutions for motorhomes

Security on the go

An Ajax system is more than usual vehicle alarms. It is a smart, informative, and comprehensive security solution. It can provide round-the-clock protection against intrusion, detect fires, inform of water leaks, or do all of these at once. The system is managed via an intuitive free app, which offers instant notifications and remote control from anywhere in the world.

Whichever your security needs on the road are, there is a suitable Ajax setup to meet them. The system can detect break-in attempts, automatically capture the intruders on a photo, and deter them with a loud sound signal. Or it can give you the option to check on your motorhome when it is parked unattended – use a motion detector with a camera to take photos on demand or by schedule and see them in the app. Tailor the system to your lifestyle on the road and enjoy your peace of mind.

Ajax setup for comprehensive motorhome protection

MotionCam (PhOD) Jeweller

A motion detector with a camera onboard takes photos by alarm. Users can see the incident within seconds in an Ajax app. Or they can check on their camper anytime with a Photo on demand feature.

LeaksProtect Jeweller

FireProtect 2 RB (Heat/Smoke) Jeweller

A fire detector informs of a threat with a near-zero chance of false alarms. Its sensors respond to temperature rises and smoke while ignoring water steam. In case of a fire, the device activates a built-in siren and immediately sends a notification to Ajax apps.

HomeSiren Jeweller

As soon as there is an alarm in the system, an indoor siren activates a loud sound signal to notify the owner of the incident and deter intruders.

DoorProtect Plus Jeweller

Thanks to shock and tilt sensors, the device detects attempts to open or knock the doors and windows out, even if they are in an airing mode.

LeaksProtect Jeweller

A detector monitors areas prone to water leakage, instantly notifying of an incident. The device can be placed even in hard-to-reach places and doesn't require installation.

Hub 2 (4G) Jeweller & 12-24V PSU

A control panel can be powered by a low-voltage power source like an automotive battery thanks to a PSU board. The hub supports two independent cellular communication channels for constant connectivity.

This is an example of an Ajax system for a motorhome. The extensive Ajax portfolio makes it possible to configure the optimal setup for specific needs.
